

The Language of God

Francis S. Collins

While we can be awed by our science and the “effectiveness of mathematics”, we may be deceiving ourselves thinking how high the tower can reach and if it is really pointing to God. Knowing a lot about nature is not necessarily knowing most, or even a slight amount, of what nature is. The idea that science can tell us about God came and went and has now come again. It is only an assumption that all nature lends itself to mathematical and scientific investigation.

Above the title of the book is stated “A scientist presents evidence for belief”. That is misleading. It does not say belief in what, but leaves the reader to make a false assumption. Actually, the book represents the new approach by evolutionists in trying to make Darwin palatable to Christians. It really has nothing in it for Christians or non-Christians. The book is a deception by an evolutionist. I would rather read my evolution straight up.
